PROJECT PORTFOLIO

Counterpoint

Transparent AI Reasoning for Traders.
The first platform to visualize the "Why" behind market moves.

THE PROBLEM

Black-Box Confusion

Trading signals today are opaque. Users receive a "BUY" alert without context, leading to blind following and inevitable losses. There is no learning, only dependency.

- ✕ No Explanation
- ✕ No Risk Context
- ✕ "Trust Me Bro" Culture

THE SOLUTION

Transparent Debate

Counterpoint replaces blind signals with a live debate between reasoning agents. Users watch the logic unfold, understand the risks, and make their own informed decisions.

- ✓ Logic in Plain English
- ✓ Real-Time Risk Checks
- ✓ Confidence Scores

The Architecture of Reasoning

At the core of Counterpoint is a proprietary 3-Agent Debate System designed to mimic the internal monologue of a professional trader.

The Bull

Analyzes upside potential.
"Why should we buy?"

The Bear

Identifies downside risks.
"Why might this fail?"

Risk Guardian

The Adult in the Room.
Checks volatility & exposure.

The Result: The Verdict. A synthesized, logic-backed recommendation with clear Entry, Exit, and Stop-Loss levels.

Technical Implementation & Innovation

Counterpoint isn't just a UI wrapper; it is a sophisticated orchestration of multiple LLM agents working in parallel.

- **Orchestration Layer**
  Manages the debate protocol, ensuring agents stay on topic and adhere to strict financial reasoning constraints.
- **Real-Time Data Integration**
  Agents analyze live market feeds (Price, Volume, RSI) to ground their arguments in factual reality.
- **Customizable Strategy Injection**
  Users can "teach" the agents their own rules (e.g., "Argue based on RSI divergence"), making the platform highly personalized.
- **Visual Confidence Engine**
  Proprietary algorithm converts qualitative arguments into a quantitative "Traffic Light" confidence score.

Core Tech Stack

- Next.js 14
- TypeScript
- Tailwind CSS
- OpenAI API / LLMs
- Supabase
- React Flow
- WebSockets
